

Ubuntu Server Boot Process

1. Power On

Hardware powers up; CPU jumps to firmware entry point

2. BIOS / UEFI Initialization

Firmware runs POST, initializes hardware

3. Boot Device Detection

Firmware locates bootable device (disk, ISO, network)

4. Boot Loader (GRUB)

GRUB loads, presents menu, locates kernel + initrd

5. Linux Kernel

Kernel loads into memory, initializes drivers & subsystems

6. init / systemd

PID 1 starts; mounts filesystems, sets runlevel/targets

7. Services Start

systemd starts daemons (SSH, networking, etc.)

8. Login Prompt

getty presents login; system ready for use
